Network Analysis of the Chronic Hepatitis C Virome Defines Hypervariable Region 1 Evolutionary Phenotypes in the Context of Humoral Immune Responses

Brendan A. Palmer,<sup>a</sup> Daniel Schmidt-Martin,<sup>a</sup> Zoya Dimitrova,<sup>b</sup> Pavel Skums,<sup>b</sup> Oria Crosble,<sup>c</sup> Elizabeth Kenny-Walsh,<sup>c</sup> Liam J. Fanning<sup>a</sup>

ASSTMAT: Hypervariable region 1 (HVR) of hepatitis Cvirus (HCV) comprises the first 27 N-terminal amino acid residues of EZ. It is classically seen as the most heterogeneous region of the HCV genome. In this study, we assessed HVRI residuation by using ultradepy processuring for a color of treatment—suit, chronically infected patients over a short, level-seep in-Organization of the sequence est into connected components that represented single nucleotide substitution events revealed a network dominated by highey context in extra the position of the sequence in the connected components that represented single nucleotide substitution events revealed a network dominated by highey context in extra the position of material sequences. IVRI whenoverse were observed to be under strong purifying (station-institution) and the process of the ingary olimication, containing antique in the containing and a strength of the containing a strength of the containi

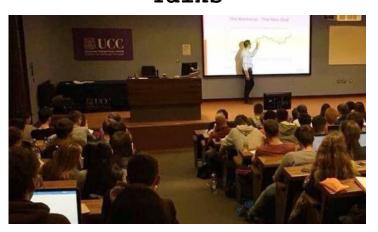

IMPORTANCE
HCV infection is often asymptomatic, and chronic infection is generally well established in advance of initial diagnosis and sub-11-CV instruction is often asymptomistic, and chronic relates the special register distribution and water of a militar algorisal and support and the control in the properties of the control in the properties of the control in the c

### Putting the pieces together

### Sounds complicated

- It isn't
- To get up and running takes only a few steps
- Any idiot could do it ....

### What is git, gist, GitHub?

git is a version control system

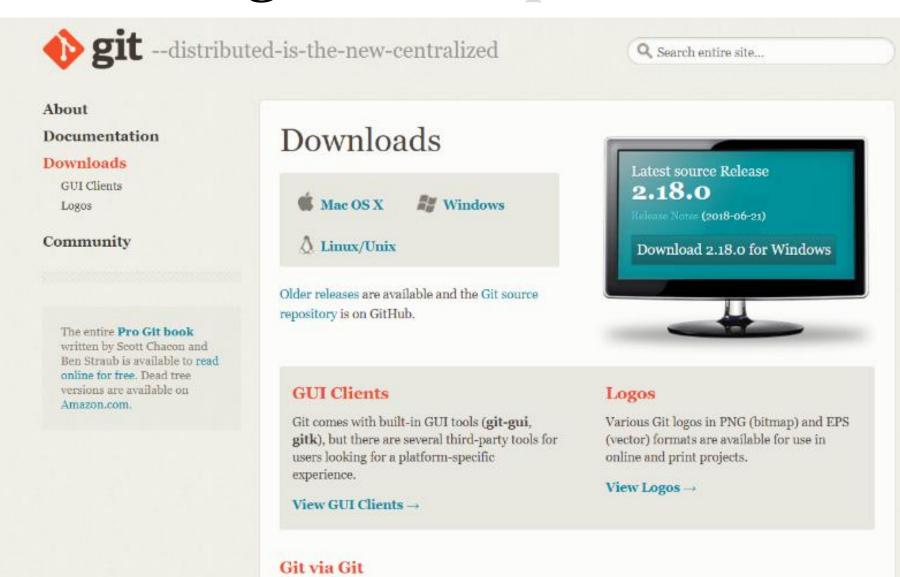

- originally designed to allow developers share code
- since repurposed to manage whole data projects
- gists are individual files or part of files that can be shared

GitHub is a hosting service for your Git projects

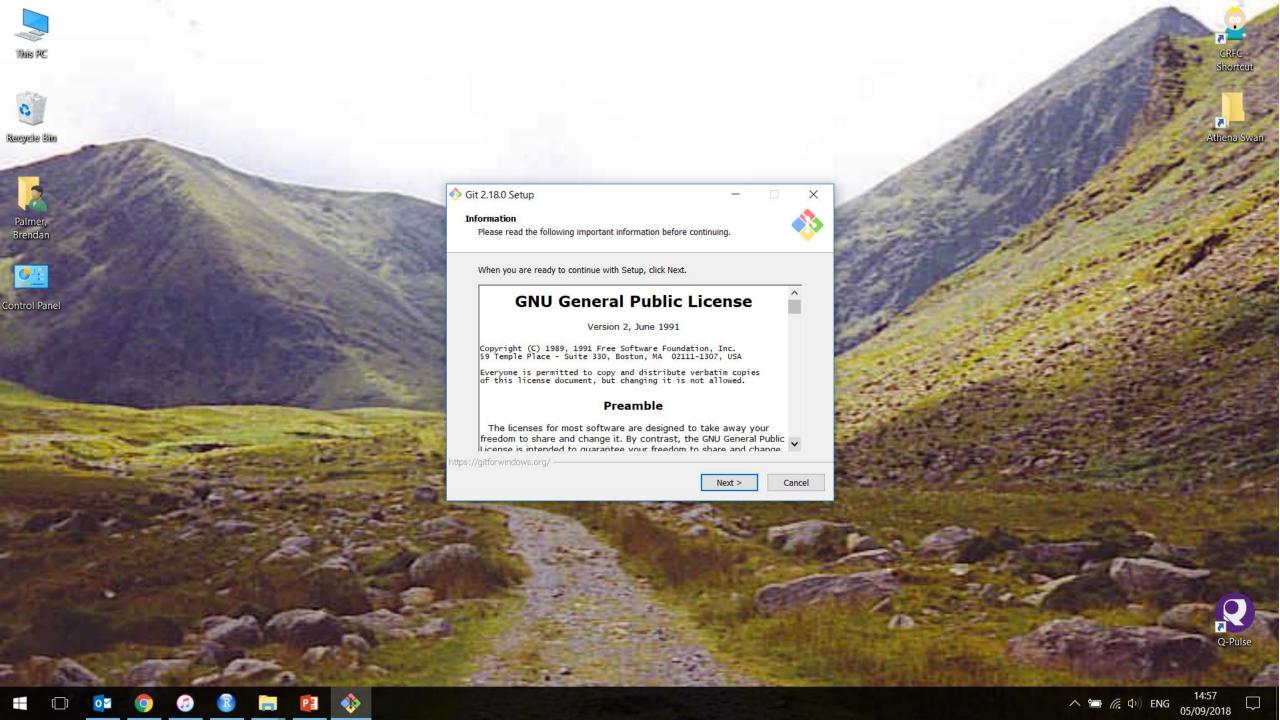

- remotely stored

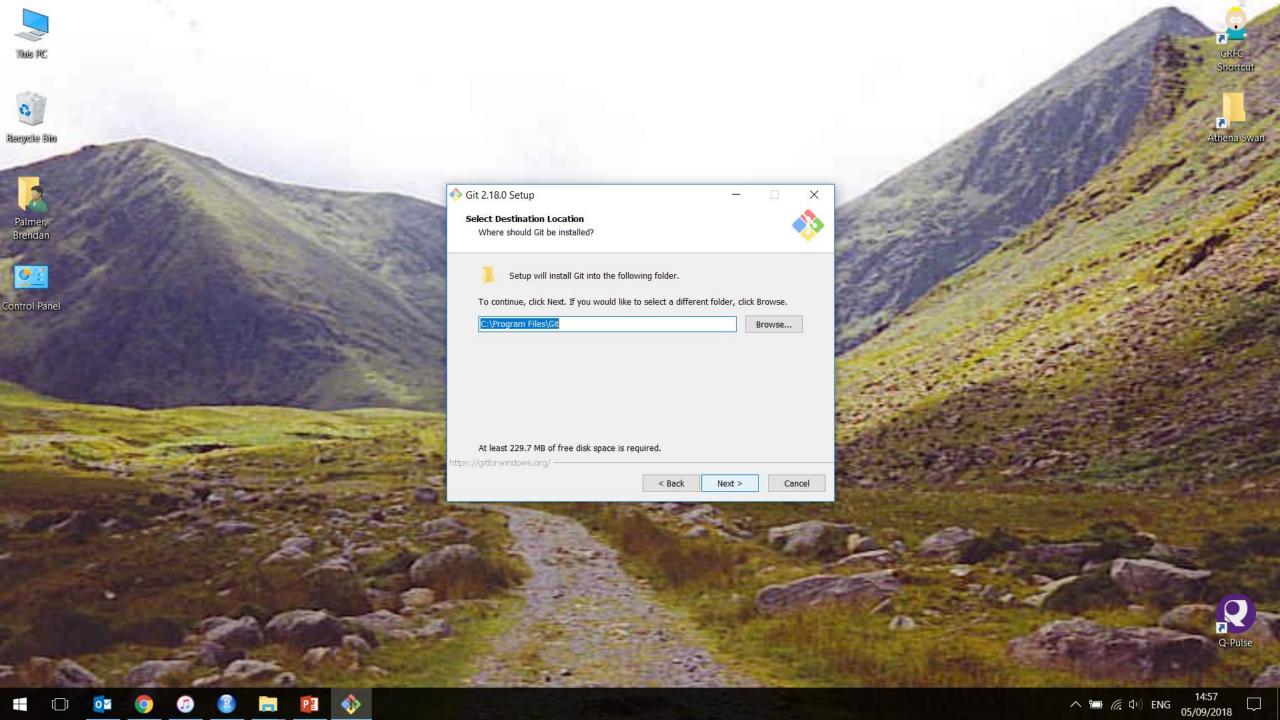

### Step 1: Install git after step 0, install R/RStudio

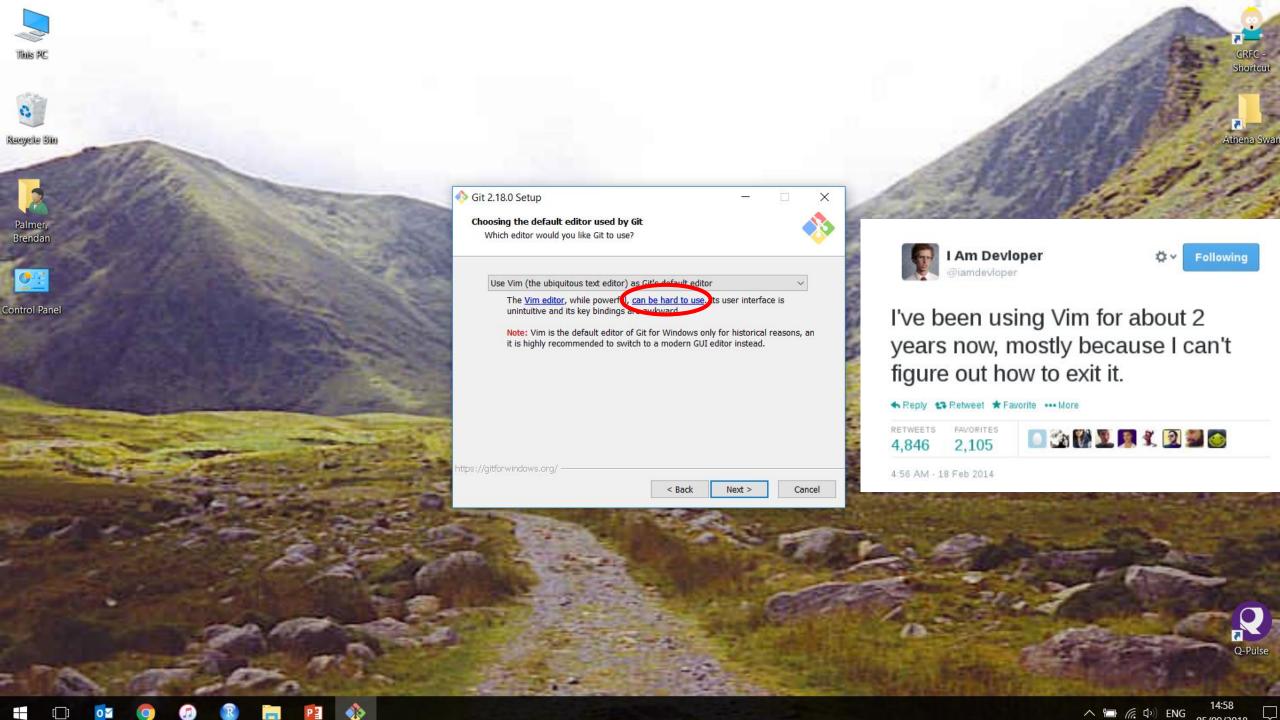

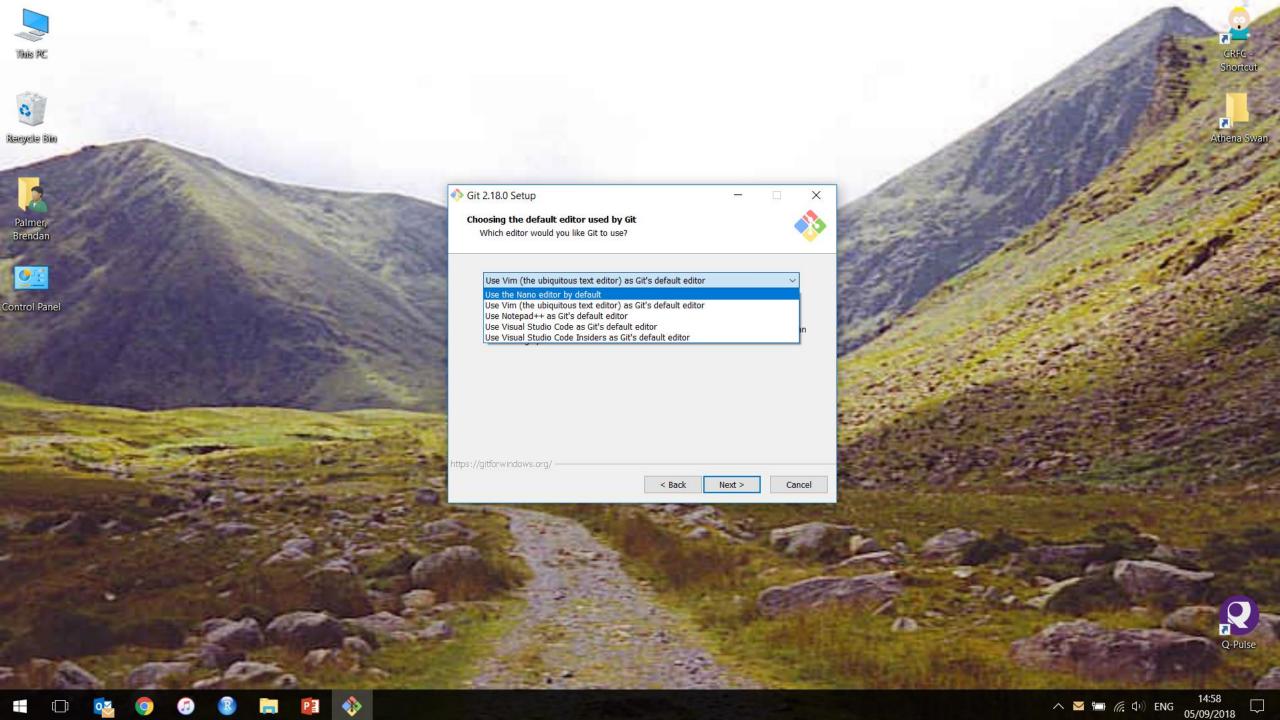

ait alone https://aithub.com/ait/ait

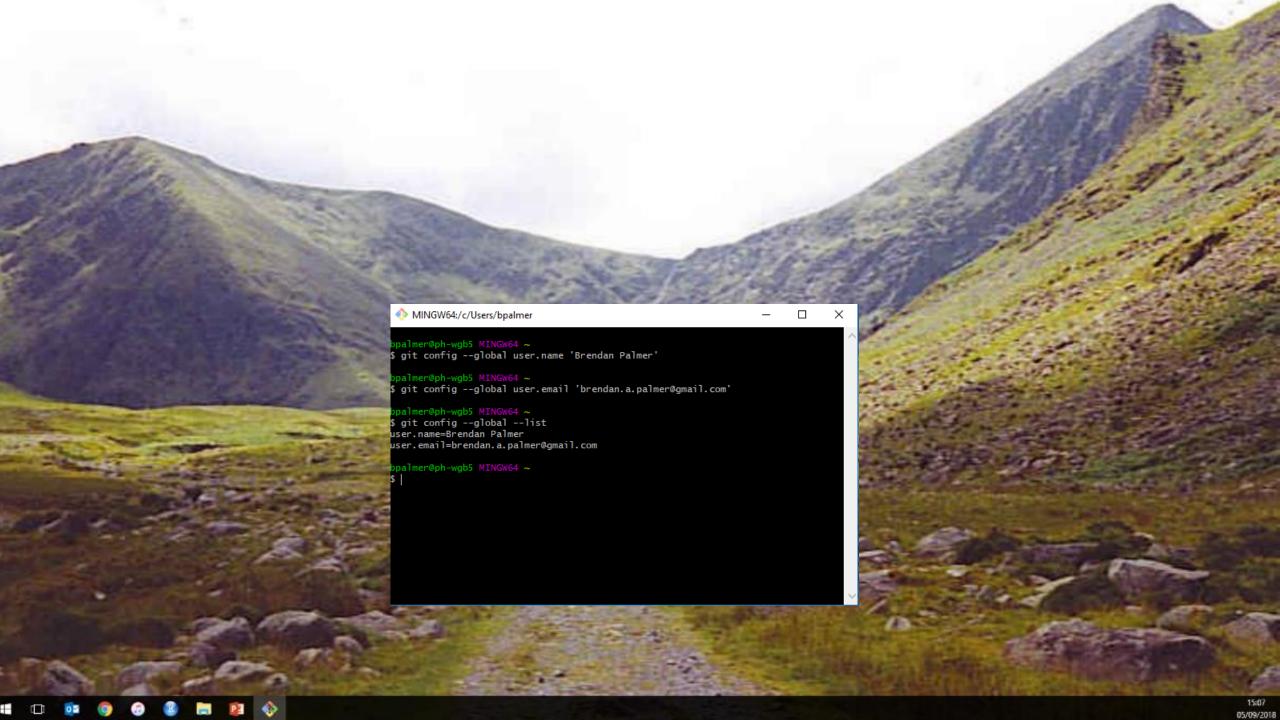

If you already have Git installed, you can get the latest development version via Git itself:

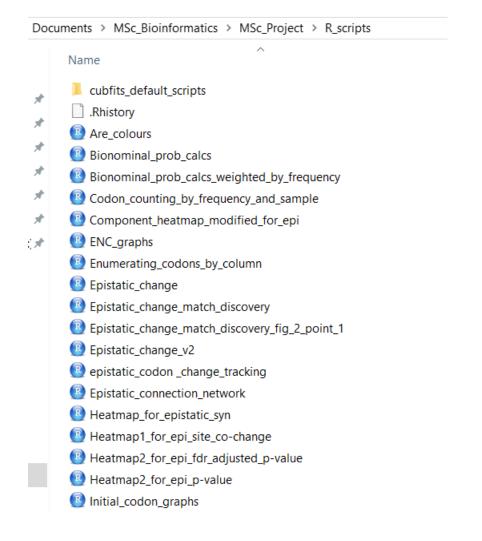

### What's there to gain

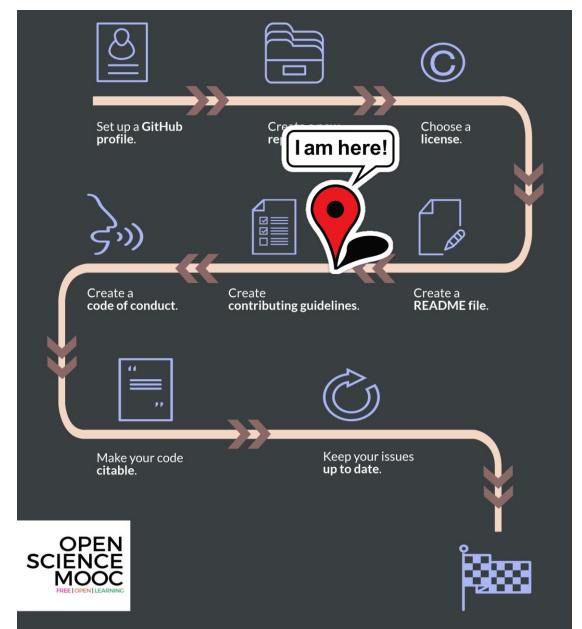

- A record of your research
- Avoid that chaotic state where you have multiple copies of the same file, but without a stupid and annoying file naming convention.

 Final Final version

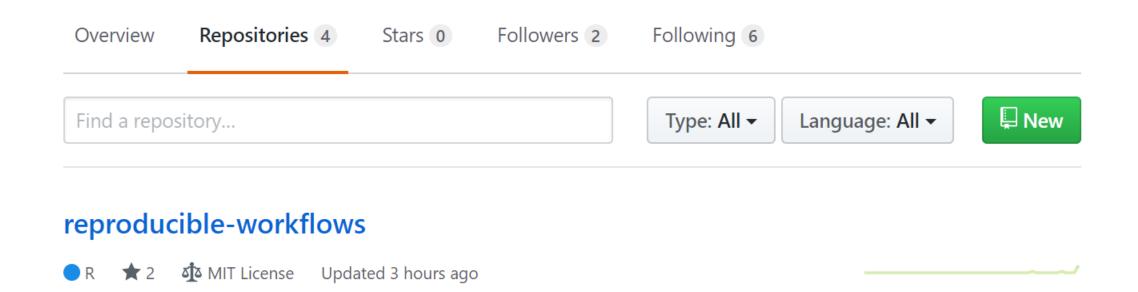

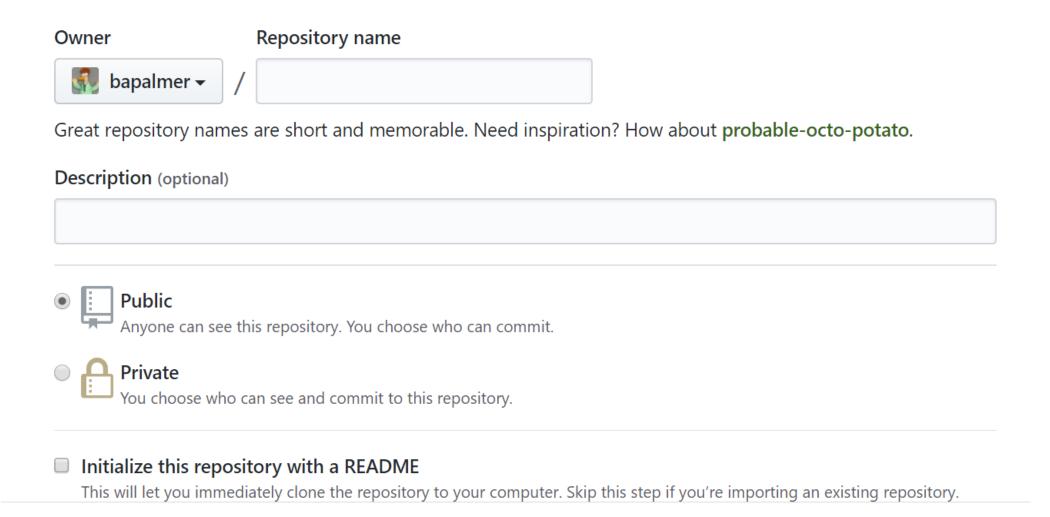

### Getting started with GitHub

## Step 2: Go to GitHub and create a repository

### Step 3: Give it a useful name

### Step 4: Populate the README file

**■ README.md** 

### SDAU-Spring-2018

#### Introductory R workshop: The tidyverse and beyond

The lecture notes and R scripts given below are from an introductory R workshop hosted by the HRB CRF-C in the Spring of 2018. The lecture notes are punctuated with prompts to jump into the R scripts as you go and to see what we're talking about. All the scripts are composed in such a way, so that you can run each line yourself and get the outputs you expect. At certain points, there are exercises for you to complete yourself, which hopefully will allow you to get a feel for writing your own code.

#### Workshop 1:

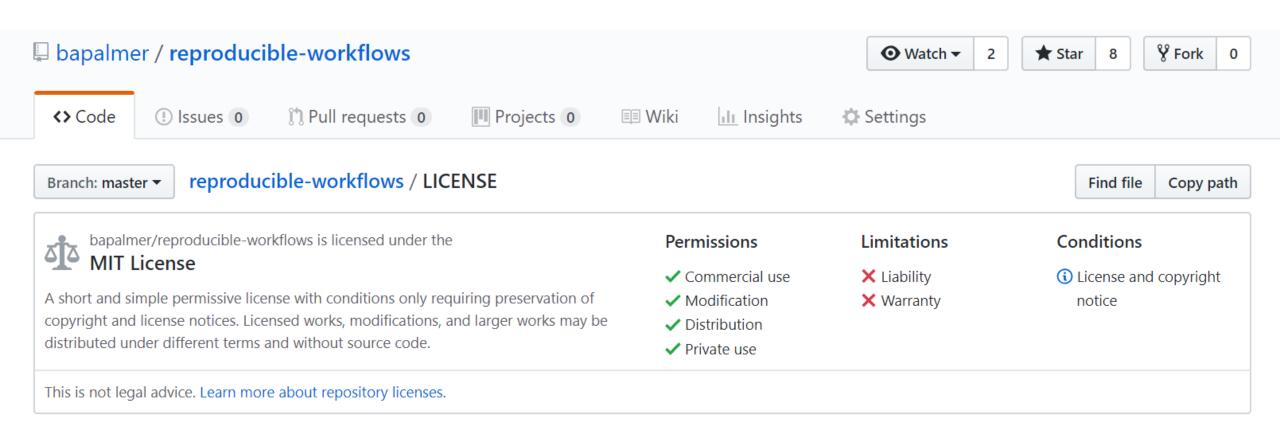

First time users are given a crash course in this session, broadly along the lines of that described by David Robinson here (http://varianceexplained.org/r/tidy-genomics/). We proceed to take it on from there. The lecture notes discuss the need for learning R, especially if you are engaging in research in the life sciences. We follow this up with an overview of R, R packages and the basic steps of data analysis.

The structure of the tidyverse code is outlined and the fundamental ideas of tidy data are described. You won't learn how to use R in this session, but hopefully you will get a sense of how it can do powerful things with very little effort.

#### Workshop 2:

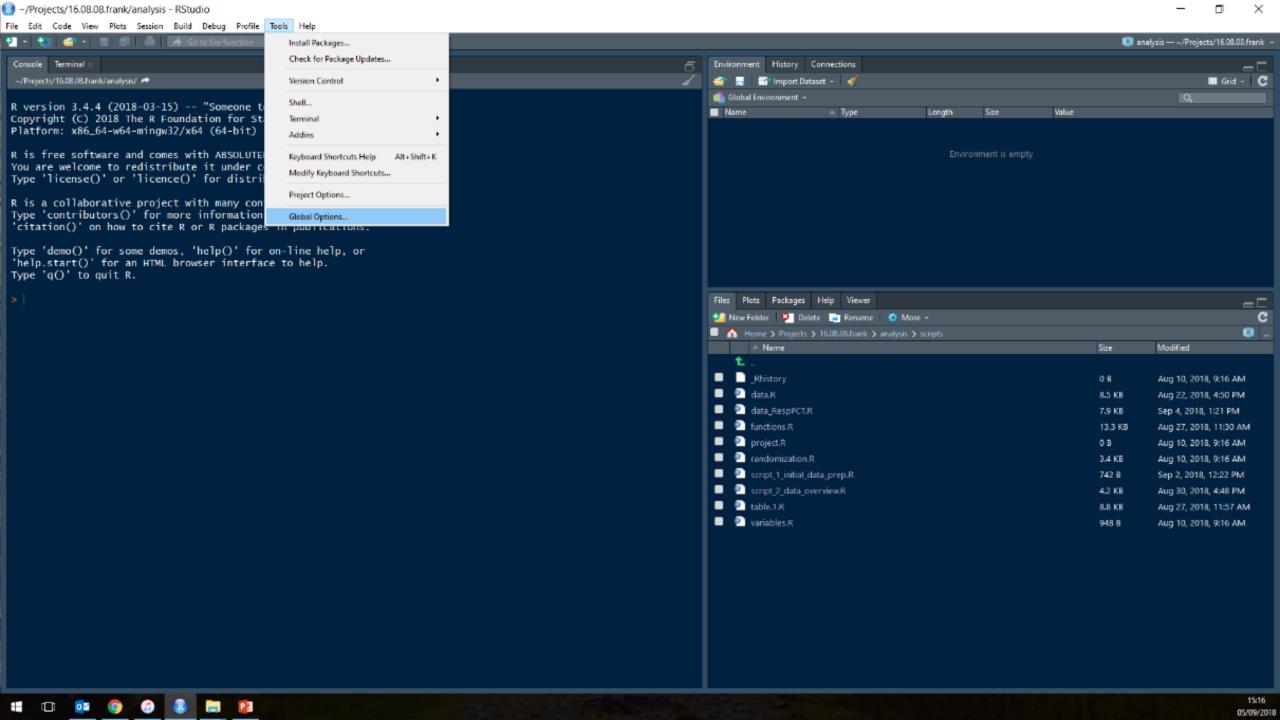

We go through the, must know, basics of the R language including data types, indexing and having a go at importing data into RStudio.

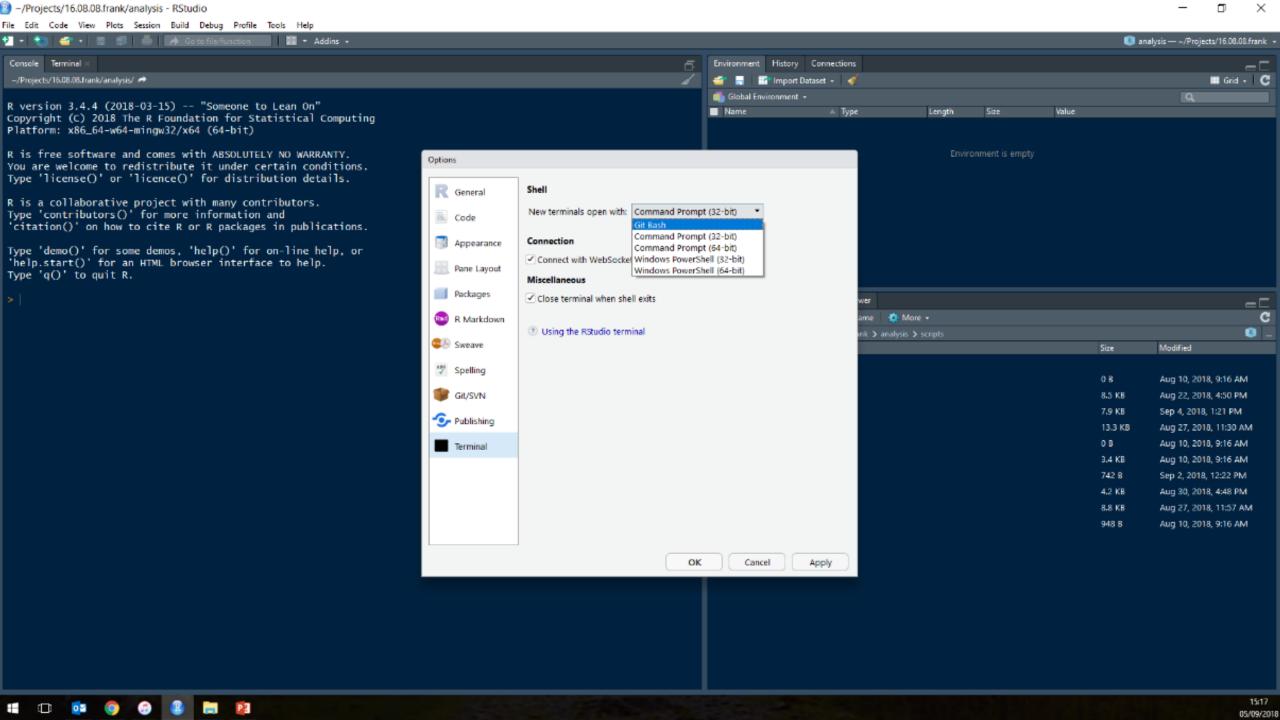

### Step 5: Add a licence

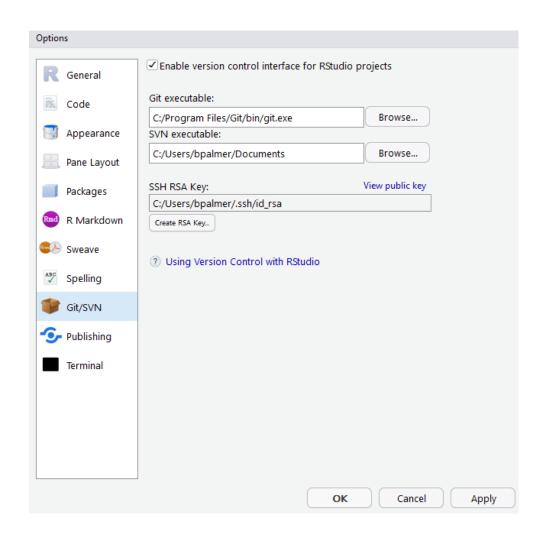

## Step 6: Interface git with RStudio

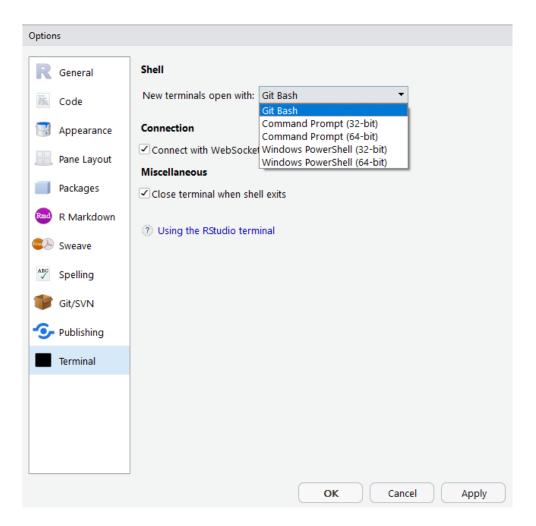

- The key here is to select the correct shell
  - Windows users have four options
    - Only one of these is correct

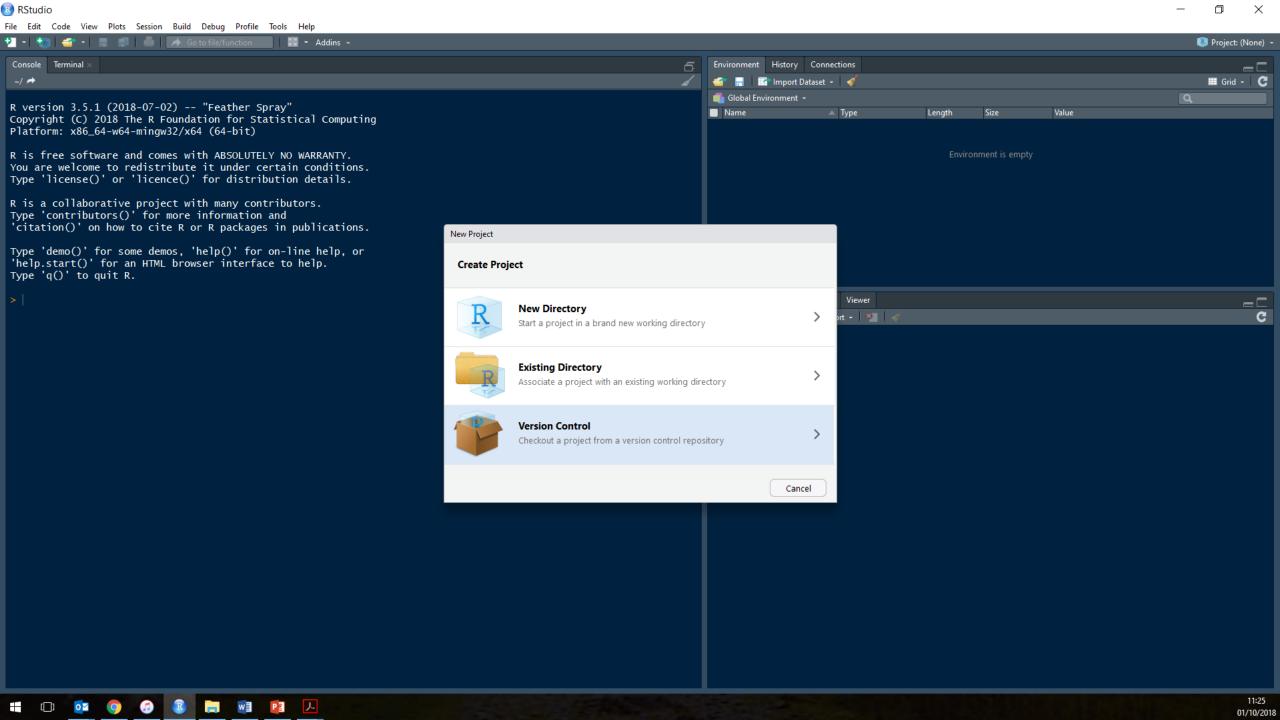

### Step 6: Interface git with RStudio

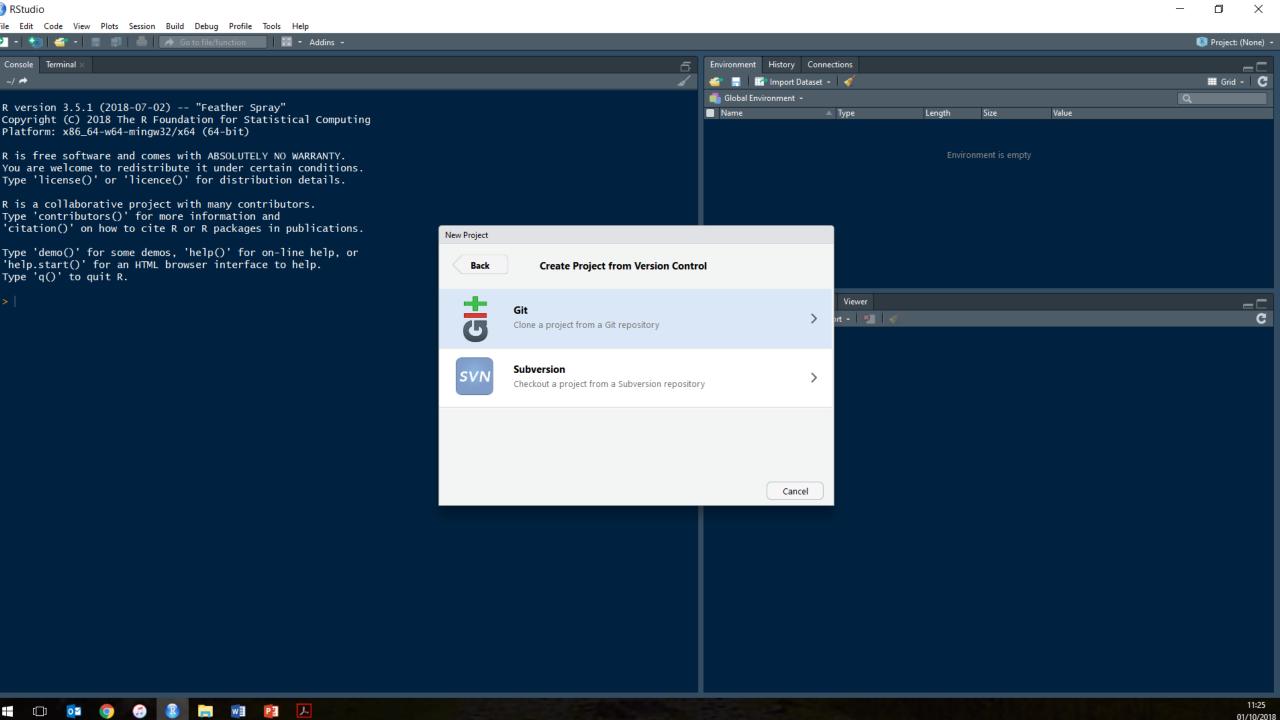

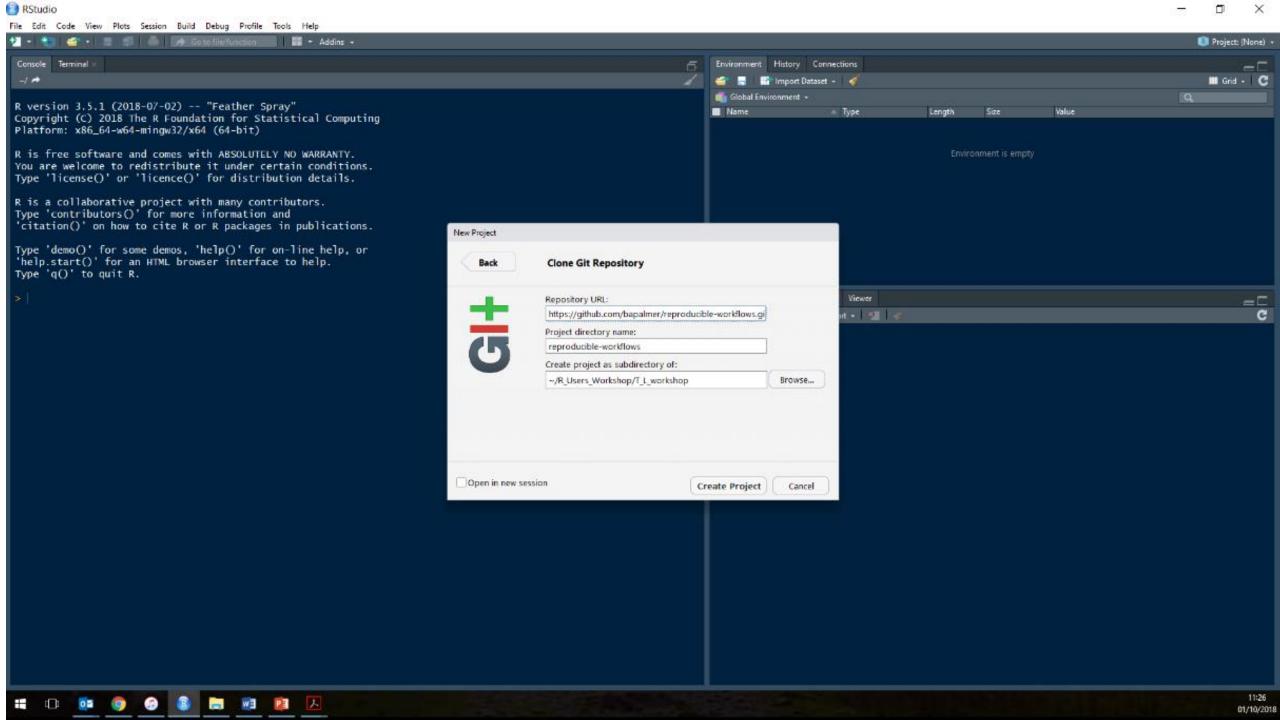

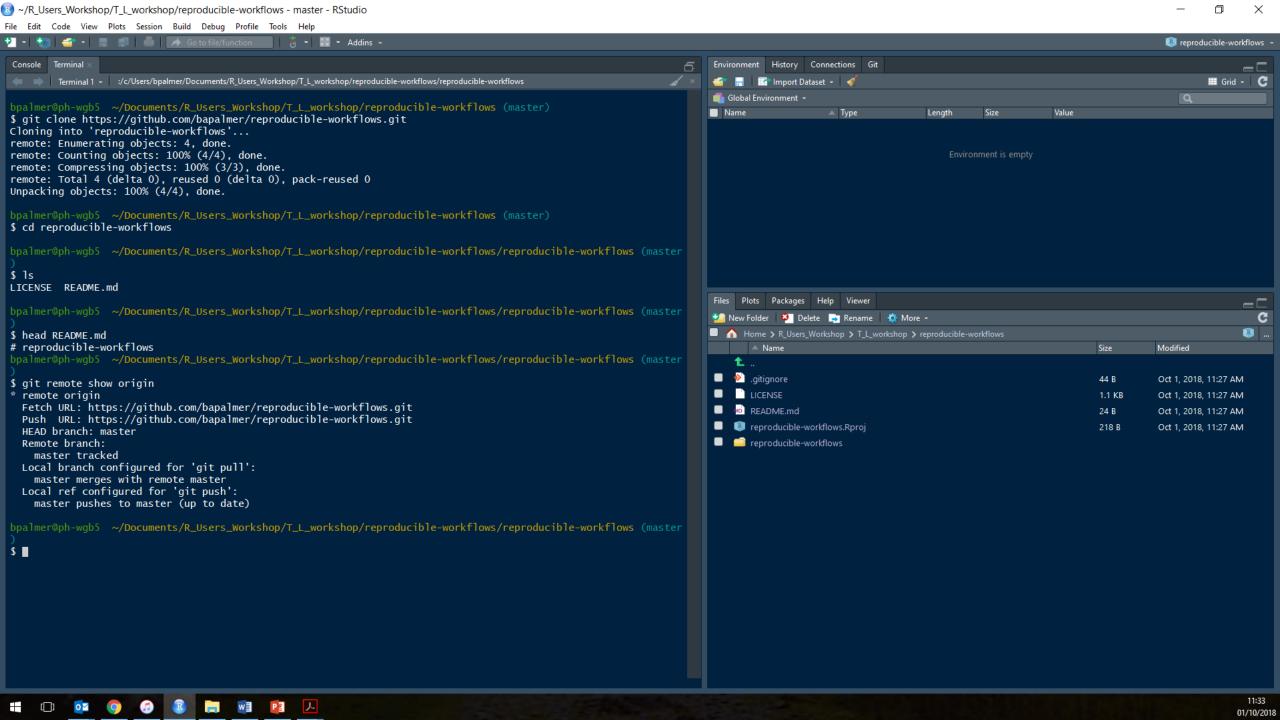

### Step 6: Interface git with RStudio

- Setup a version control R project to interface with the newly created repository

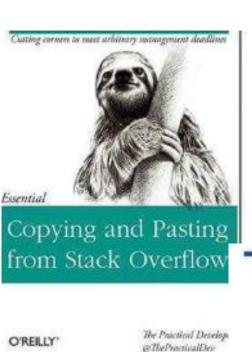

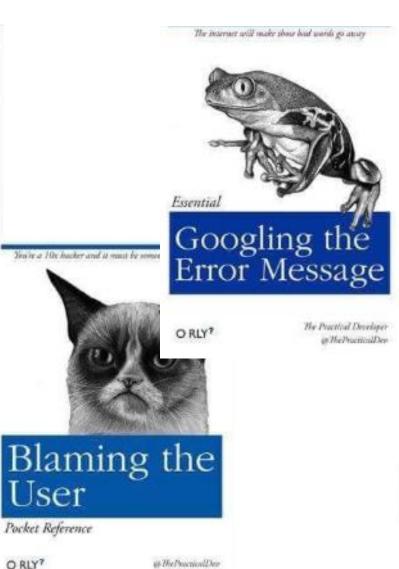

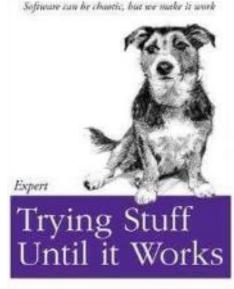

### From the people who brought you.....

@TheProcticalDev

Maybe you should have com-

to actually learn any new programming concept The Practical Developer @ThePracticalDes

O RLY7

### I know git, depending on what you mean by "know"

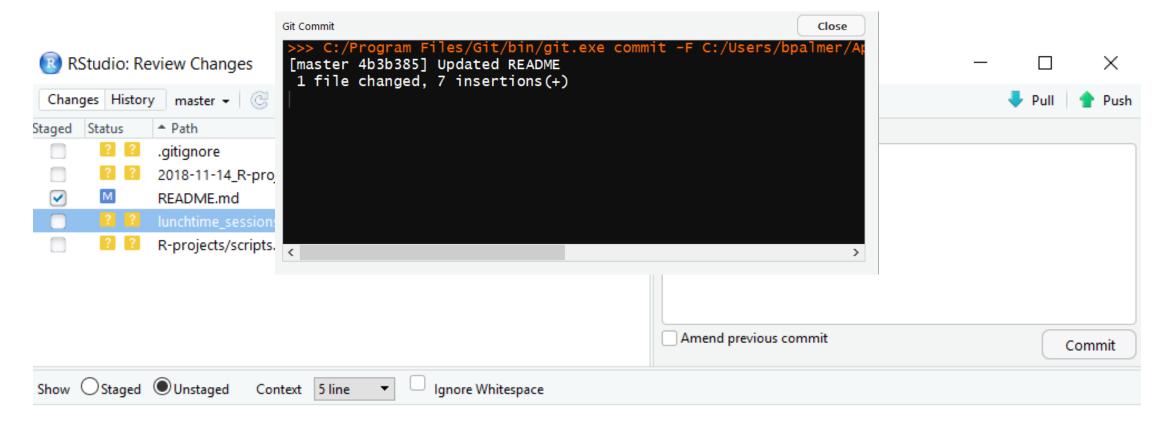

### JD speaks the truth

### 4 main commands just to get started with.....

- Add: This is where you identify the files you wan to upload
- Commit: This is like "saving" your work by creating a new version or copy
- **Push:** This is how you send files from your local project to the online repository
- Pull: This is how you get files from your online repository to your local project

### But I don't know anything about command line

- The good news here is that you don't need to .....

THIS IS GIT. IT TRACKS COLLABORATIVE WORK ON PROJECTS THROUGH A BEAUTIFUL DISTRIBUTED GRAPH THEORY TREE MODEL.

COOL. HOU DO WE USE IT?

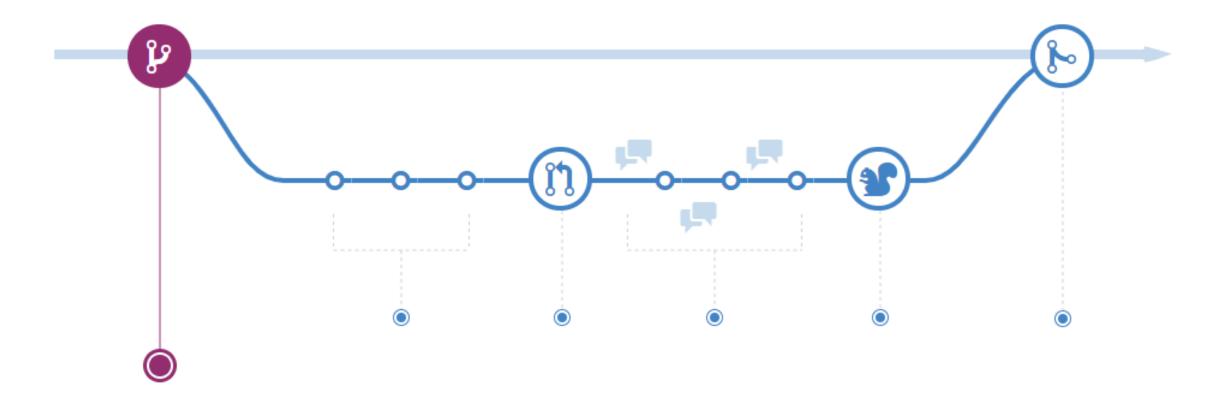

NO IDEA. JUST MEMORIZE THESE SHELL COMMANDS AND TYPE THEM TO SYNC UP. IF YOU GET ERRORS, SAVE YOUR WORK ELSEWHERE, DELETE THE PROJECT, AND DOUNLOAD A FRESH COPY.

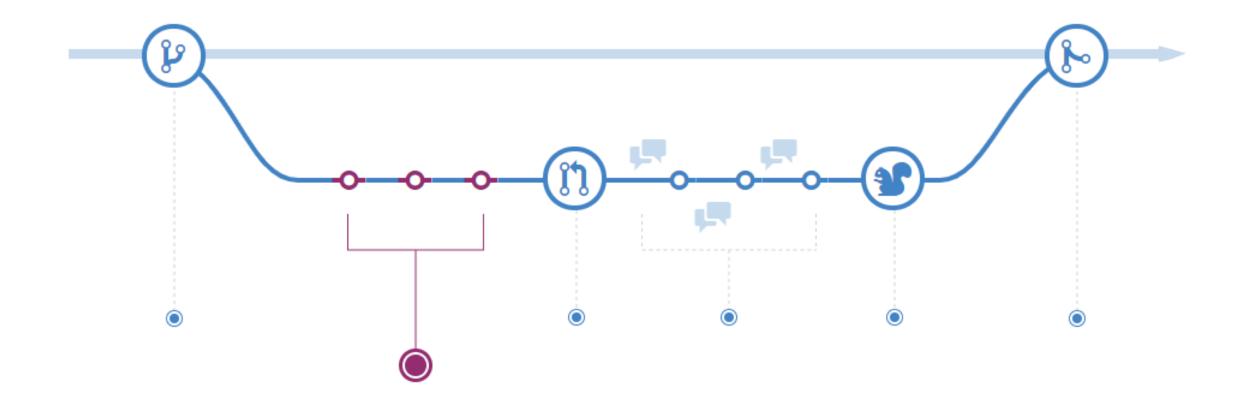

### Obviously there are others

```
Initialise
     Checkout
          Clone
                Fork
                     Branch
                           Master
Index
                                Head
     Merge
                                      Stage
                                           Fetch
          Issue
                Clean
                                                 Check
                     Status
                           Commit message
                                           Working directory
```
